FOOD RECIPE WEBSITE USING REACT JS:

I created a Food recipe website by using React js. It was done in Visual Studio Software. In these, I used react for building an interactive web application to show the varieties of food. The react is used for building interactive user-interfaces web applications quickly and efficiently by using less code. In this food recipe website, I fetched the image by using API. The API is used to interact or communicate with one software application to another software application. On this website we can see many different varieties of foods like chicken, mutton, juice, etc…, On these, we click any food dish means it shows the picture of the dish and the procedure of making that dish and also given the source link from API to see the video of making the dish and also it show the ingredient measurement like ½ gee, 2kg wheat etc. It has fields like food name, ingredients, preparation steps, cooking time, difficulty level, and dietary information, etc. In these I used javascript, The Javascript is a Client-side scripting language used for web applications. In the website, I added the alert message like popup, by opening or refreshing the website which shows welcome to the website, and also I added a color change in heading by using javascript. It changes the twenty different colors in the title of the website.
